

AI Video Automation Pipeline

Daily social video for a US election campaign, produced without a camera or an editor.

Our client is a candidate standing in a US general election. To stay visible he needed to publish short video constantly, reacting to news while it was still news. A small communications team cannot research, script, film, edit, caption, schedule and post at that pace.

We built a pipeline that does all of it except the two decisions that should stay with a human.

The pipeline, step by step

- 1 It reads the news, every morning**
The system searches for the issues the candidate campaigns on, for news in his own district, and for anything said by or about his opponent. It opens the full articles, not just the headlines.
- 2 It works out what actually matters today**
Duplicate coverage is grouped together and each story is scored: how many separate outlets ran it, how local it is, how fresh it is, and whether it names someone who matters to the race. Anything already covered that week is filtered out. A dedicated selection step then picks the three stories most worth speaking about.
- 3 It writes the angle in the candidate's voice**
Each of the three topics arrives with a position already drafted written to match how the candidate actually speaks and checked against the positions he has already published.
- 4 A person chooses the story** **HUMAN**
The team reads three lines and picks one. Roughly a two-minute decision. Anything that contradicts a published position is flagged and cannot be generated until a person clears it.
- 5 It writes three scripts, and everything around them**
One click produces three versions of the script, the same message with a different opening and rhythm plus captions written separately for each social platform and a matching hashtag set.
- 6 It builds the finished video**
An AI presenter delivers the chosen script. Word-level captions are burned in automatically, with the highlight styling varied run to run so the feed never looks templated.
- 7 A person approves, then it publishes itself** **HUMAN**
The team watches the finished video and sets a date and time. It then posts to each platform on schedule, at a slightly randomized minute so the account never looks like a machine posting on the hour.

And then it learns

Every published video is measured daily. Once a week the system compares the strongest videos against the weakest, finds what the winners have in common, and writes that lesson straight into the instructions used for the next round of scripts. Most content systems skip this, and it is why the output is measurably better in month three than on day one without anyone maintaining it.

Two decisions stay human, on purpose

Which story is worth a video, and whether the finished video goes out. Nothing reaches a public account until a person has watched it and approved it.

Built-in guardrails

- **No invented facts.** Scripts may only use information from the source article, no statistics, dates or quotes that are not in the original reporting.
- **No contradicting yourself.** Every angle is checked against the client's published positions. A conflict blocks generation until a human resolves it.
- **Disclosure by default.** Every post carries an AI-disclosure line automatically.
- **Nothing posts silently.** Every stage is logged, so any published video traces back to the article it came from.

The same pipeline works for other businesses

Nothing about the structure is specific to politics. Underneath it is always the same shape - **watch a source** → **decide what matters** → **write it in your voice** → **produce it** → **a human approves** → **publish** → **measure** → **improve**. Only the source and the output change.

INDUSTRY	WHAT IT WATCHES	WHAT IT PUBLISHES
Property	New listings, price reductions, local market news	A walkthrough video the same morning a listing goes live
Automotive	New stock arriving on the forecourt	Per-vehicle feature video with pricing captions
Clinics & professional services	Regulatory changes, seasonal health topics	Compliant educational explainers, no practitioner time needed
E-commerce	Trending products, stock levels, competitor pricing	Product video tied to what is actually selling this week

What we would need to build yours

- **Your sources:** news, a product feed, your CRM, or a list you maintain.
- **Your voice:** examples of how your brand or spokesperson already sounds.
- **Your platforms:** which channels you publish to.
- **Your approver:** who signs off before anything goes live.
